Restoration of cooling towers

Complete restoration of reinforced concrete structures, such as cooling towers in the chemical and petrochemical sector, carried out by the Rohrer Group:

Old cooling towers in need of an overhaul and undermined by pollutant emissions are structurally restored (as well in site-mixed concrete or in prefabricated components). This ensures the stability and the serviceability for the next decades!

- 1) Concrete surface reinforced by high-pressure water jets
- 2) Adhesive bond
- 3) High-performance mortar

All of our services at one glance:

- Installation of scaffolds for cooling towers, of heavy load platforms and provisional stairways
- Deposition of damaged concrete up to structural reinforcement by high-pressure water jets
- Reprofiling and restoration of the concrete covering by structurally supporting high-performance mortar in adhesive bond to the remaining concrete substance
